

Environmental & Social Review Journal – Vol 2, Dec 2019

Waste control is an important aspect of preserving creation.

In my previous journal we discussed water preservation which is also related to another topic that is waste and environmental preservation: waste affects the clean water source.

So on today's topic, we will see now how our village is managing waste control.

Waste is the outcome of our day to day life. Waste comes in categories which are liquid waste, solid waste, gaseous waste. It is material that is of no use anymore. Most of the material can be recycled and become useful again. Recycled waste can be sources of water, gas, and fertilizer. Recycling can also create employment, something I have learned when I visited Biomass Energy Carbon Capture and Storage schemes (waste) in Metabulon: Wow, you can walk and don't smell that bad heavy smell, so no pollution at all.

So much different on how waste is controlled here in Mseroe and Mrieny. Most of the dumping places are so stinking and uncontrolled burning causes heavy air pollution and is very poisonous. Most of the waste is piled up on the side of the road or near home residents, where it is mostly put in a pitch in the backyard. So all the waste is on one big heap of either plastic bottles, clothes, home used domestics or broken items and lawn glass leaf and so on. Then striking a match all is put on heavy fire and huge black smoke.

Apparently we don't know what we breathe anymore, the polluting smoke is everywhere and cannot be easily controlled. For instance, the burn from the Mkolowony Dispensary waste is very dangerous, and there you find no separation of the burning place and the hospital. For sure it is a disaster and you can get sick while you lie restless in the hospital bed. It is very important to group waste in different bins and this knowledge should be publicized the way it is done in Refrath.

The following are the ways that can help to control waste in Mseroe /Mrieny village to keep environment clean and suitable for our life:

- To encourage villagers in their homes, schools, dispensaries, markets also beside the roads to have different colourful bins that categorize different types of waste.
- There should be a vehicle to pick up waste to the deposit area
- Hence to educate people about the modern ways of recycling and to provide modern equipment for those processes
- To implement laws and regulations which prohibit people to throw waste into open space
- To encourage environmental clubs to the youth in schools and church
- Lastly providing employment to the people especially youth, to clean public areas especially roads, markets, and the hospital.

Therefore, we have to protect our environment for preserving creation of Mt. Kilimanjaro. The nature will be protected as we start protecting our environment of our homes, church, school, market, and society. Also these help to make our village to be an example to others.

I'm glad it was a nice topic and I summarized it as much as possible. The next possible topic will be the continuation of waste and pollution. It was a busy celebrating week. I graduated last Friday and I enjoyed it most. I wish you guys were here, God bless us all, guard us on preserving our creation.
